

LOGONET non elastic nets

TECHNOLOGICAL RECOMMENDATIONS

Technology for LOGONET tubed non elastic nets use in the sausage production

When preparing for the nets use in the production room, it is necessary to allocate a place near the clipper, protected from water ingress.

For manufacturing sausage in the net, it is necessary:

- to install on the bobbin the shirred casing prepared for stuffing;
- to pull the front edge of the casing towards the clipper;
- to install the net tube on the bobbin on top of the casing;
- to remove the front rubber ring that holds the net on the tube. Do not remove the REAR rubber ring, to prevent the net from falling on the casing that goes inside the cylinder during the stuffing process;
- to pull the front edge of the net onto the casing;
- to put the clip on the casing with the net;
- to adjust the brake ring;
- during the filling process, to make sure that the net is evenly drawn;
- to maintain the cylinder with the net in the same position to achieve straight, longitudinal bundles, parallel to the sausage; - not to allow twisting along the longitudinal axis.

STORAGE

It is necessary to store the net in the manufacturer's package, in closed, clean, dry storage rooms without foreign odors, protected from sunlight, at a distance of at least 1 m from heating devices, at temperature of 10-30°C
